Abstract (en)

[origin: EP2497402A2] The enclosure (1) has a movable glass door (4) i.e. sliding door, movable along a movement path (16). A mechanical braking device (2) enables braking of the door in a portion of the movement path. The braking device comprises a carriage, which is displaceably arranged in profile guides in an end section of the movement path, where the carriage comes into engagement with the door to brake the movement of the door. An energy storage e.g. spring, cooperates with the carriage such that braking force moves the door into a closing position. The movement path is formed as a circular path portion.
