Abstract (en)  
[origin: EP2497883A2] The device (1) has a support element (5) e.g. locking hook, exhibiting a locking position for engagement with a support surface at another support element. The support element is formed as a body rigidly connecting an upper support surface, a lower support surface and another support surface with one another. Each support element is pivotably mounted at a pivot axis at a guide element (3) e.g. groove-like channel, between the locking position and a release position. The support surfaces are arranged outside the guide element. The body is an injection molded plastic body or an integral metal or ceramic body.
