Abstract (en)
[origin: EP2497890A2] The device (B) has a first part or common base (310) inserted into a hollow core (110) of an open end of a section or a section assembly (100) to be closed. A specific second part (320) e.g. cap, is chosen from a set of different second parts according to a preformation adopted by the open end of the section or the section assembly. The base has a volume (311) partially occupying the hollow core and an outer surface provided with flexible transverse fins (312) projecting toward an inner surface of the core.
