Abstract (en)

[origin: WO2011057621A1] The invention relates to a method for producing an integrally bladed rotor, in particular a gas turbine rotor, by means of joining, comprising the following steps: - providing a blade (10) having a joining surface; - providing a retaining device having two clamping jaws (28); - retaining the blade (10) at two opposite points of the blade (10) by means of the clamping jaws (28) in a purely force-closed manner; and - pressing the blade (10) retained in a force-closed manner onto a main rotor body so that the blade (10) independently orients itself in a joining position. The invention further relates to a device for producing an integrally bladed rotor, comprising a retaining device for a blade (10) having two clamping jaws (28), wherein the blade (10) is retained at two opposite points in a purely force-closed manner by pressing together the clamping jaws, and a device for pressing the blade (10) retained in a force-closed manner onto a main rotor body in such a way that the blade (10) independently orients itself in a joining position.
