Abstract (en)

[origin: WO2011054823A1] The invention relates to a rotational printing machine having at least one color or printing unit (25, 26), wherein a print cylinder (2) bearing the print image can be rolled over a material to be printed (4) and thereby printing ink can be transferred to the material to be printed, wherein the printing cylinder bears at least one register mark (18) that can also be printed. A sensor (6) is provided for determining the position of the printed register marks (7) on the printed material (4), wherein the sensor (6) can be slid transverse to the material to be printed (4) by means of a sliding device (8, 9). A directional device (14, 22) is provided, to which the sensor (6) is coupled and with which said sensor can be jointly slid, and by means of which the surface of the printed cylinder (2) can be targeted.
