Abstract (en)
[origin: WO2011059341A1] Process for the production of magnesium containing aluminium alloys, in particular magnesium containing rolled aluminium strip or sheet material, The process is characterized by the following steps: E. rolling to final thickness of the aluminium web F. levelling of the aluminium web G. electrochemical degreasing of the aluminium web H. soft annealing of the aluminium web. The electrochemical degreasing is done by alternating current (AC) processing of the aluminium sheet material in hot sulphuric acid resulting in a thin aluminium oxide layer on the surface of between 10 - 20nm. The hereby degreased material give excellent adhesion since there is no magnesium oxide on the surface.
