Abstract (en)
[origin: EP2500306A2] The method involves storing fiber material (5) in a tin (8) arranged at an exit region of a textile machine, by a storage device i.e. tray plate (7), at a predefined conveying speed. An electrical signal is generated by a sensor (11) during the storage of the fiber material as soon as the stored fiber material touches the storage device. The conveying speed of the storage device is controlled based on the electrical signal and the contact pressure exerted on the storage device by the stored fiber material, where the contact pressure is measured continuously or in preset time intervals. The sensor is selected from a group comprising a force measuring sensor, a touch sensor, a pressure sensor, a proximity sensor, an optical sensor or a sensor utilized for determining the friction between the fiber material and the storage device. An independent claim is also included for a textile machine.
