Abstract (en)
[origin: EP2500885A1] The method involves determining an offset time between a predetermined switching time of a signal program and a predetermined switching time of another signal program, and determining the synchronization region with respect to global offset time change. The program signal is corrected in the latter predetermined switching time of each node with the aid of the determined global offset time change. Independent claims are included for the following: (1) a control system for controlling traffic flow at multiple signalized nodes in a synchronization region; and (2) a computer program product is provided in a loadable processor of a computing device.
