Abstract (en)

[origin: EP2502865A1] Provided is a yarn winding machine configured to detect a core tube length of a yarn supply bobbin to thereby correctly obtain the amount of yarn wound on the yarn supply bobbin. In a yarn supply bobbin holder, a yarn supply bobbin having a yarn wound on a core tube thereof is set. A winding part winds, into a package, the yarn drawn out from the yarn supply bobbin. A core tube detection sensor detects a core tube length of the yarn supply bobbin set in the yarn supply bobbin holder. A stepping motor is configured to move the core tube detection sensor in a longitudinal direction of the core tube and to control the amount of movement thereof. A calculation part calculates the core tube length based on the amount of movement of the core tube detection sensor moved by the stepping motor.
