Abstract (en)

[origin: EP2503527A1] The method involves providing a threshold value for a reception level in a transmitting message and sending the message with the provided limit. A message is received and the signal strength is determined while receiving the message. The threshold value from the received message is compared with determined reception strength of system attendant. Independent claims are also included for the following: (1) a communication system with sending system attendant, with a coverage control; and (2) a communication terminal, particularly hazard detector, for a hazard detection system with controlling device.
