Abstract (en)

[origin: WO2011061463A1] The invention relates to a device for a tight connection between two housings (1, 2), a first housing (1) comprising a wall (3), an opening (4), a flange (5) and a door (6), and a second housing (2) comprising a wall (7), an opening (8), a flange (9) and a door (10). The flanges (5 and 9) are complementary, and means are used to displace the door (6). Means are used to hold said two doors (6 and 10) against each other, and the housings (1 and 2) communicate between each other via a communication space (13). There is an inner annular critical line (LCi) on the door (6) and an outer annular critical line (LCe) of risk of contamination on the flange (9). The device comprises means (25 and/or 26) that are structurally integrated into the door (6) and/or the flange (9) and can form a separation (25, 26) between the communication space (13) and the inner annular critical line (LCi) and/or the outer annular critical line (LCe), when the door (6) and the door (10) are open.
