Abstract (en)

[origin: EP2505744A2] The moving platen (1) has a slotted lever (13) for guiding a locking element (17) of a connecting rod closure of a window- or door wing. The slotted lever has a slot section (14) which defines a functional position of the locking element, in which the window- or door wing is placed against a window frame. The slotted lever has an undersized and deformable holding portion in the slot section opposite to the locking element, such that the locking element is guided free from backlash in the slot section.
