Abstract (en)

[origin: EP2505753A1] The device (1) has ball screws arranged coaxially with joints formed by bearings (6, 7). A cage (9) is driven in rotation by an opening frame for allowing translation of a hinge pin (8). A damping unit (11) is arranged on a side of the hinge pin. The damping unit dampens the opening frame during operation. A blocking unit (12) is arranged on another side of the hinge pin. The blocking unit blocks the opening frame in a set of positions of the opening frame relative to a vehicle (3). The hinge pin actuates the damping unit and the blocking unit during translation.
