Abstract (en)
[origin: EP2506671A2] The device has a high frequency unit (34a) i.e. inverter, for supplying energy to three independent heating units (14a-20a) e.g. inductor coils. The high frequency unit is thermally contacted with an integrated cooling body (44a). A cooling ventilator (46a) cools the cooling body. Two equipotential connecting paths (22a, 24a) are provided between a filter assembly (10a) and a power assembly (12a), and transfer large part of energy from the filter assembly to the heating units. A current supply unit (38a) supplies the energy to a control unit (40a).
