Abstract (en)
[origin: WO2011066870A1] The invention relates to a folding chair (10), comprising a base part (12), to which a backrest (14) is fastened so as to protrude upward, and comprising a seat plate (16), which can be swiveled back and forth about a swivel axis (18) between a folded-open seat position and a resting position folded up toward the backrest (14) depending on gravity. The backrest (14) has two laterally opposite backrest projections (20) on the underside thereof. A backrest hole (24) is laterally bounded by the inner surfaces (22) of the backrest projections facing each other. The seat plate (16) has on the rear thereof a seat plate extension (38) associated with the backrest hole (24). The base part (12) comprises a pair of spaced vertical bracket elements (28), which are fastened to the inner surfaces (22) of the backrest projections (20) at the top-side end sections (34) of the spaced vertical bracket elements. The swivel axis (18) extends through the two backrest projections (28) and through the seat plate extension (38).
