Abstract (en)
[origin: GB2475901A] The invention relates to stimulatory device 10 which allows the user to control and adjust the amplitude and frequency of the vibrations applied to the frenulum, whilst being an essentially hands-free device, so that the user does not have to manually hold or manipulate the device during use. The device has a holding means 2, which may be an elasticised strap, to hold the device in place against the frenulum. Vibratory surface 1 may be shaped to receive the penis. Motor 3 creates the vibrations, which may be controlled using a control device 11 which has a housing 6 for batteries. The vibratory means and control means may be linked with a wire 4 or the control device may be a remote control. The frequency of vibration is up to 150Hz, and amplitude is up to 3mm. A method of stimulating the frenulum using the device is also claimed.
