Abstract (en)  
[origin: EP2508087A2] The invention relates to a brassiere consisting of an integral body having a front portion (1), and a rear portion (2) as a lateral extension of the front portion (1). The edge considered to be the lower edge, of the front portion (1) as well as of the rear portion (2), has an elastic band (3) which supports the entire structure of the brassiere. The center of the elastic band (3) extends into an ascending sector defining a bridge (4) having concave lateral edges (5) and a lower edge (6) which is also curved-concave, while the tops of said lateral edge also have divergent sections (7) suitable for adapting to the contour of the breasts of the user. The bridge (4) has cushioned padding (12), which affects the intermammary area up to the neckline (9) as well as the semi-perimeter of the lower contour of the breasts (14), including the lateral portions or sides (10) of the armholes, said padding also affecting the rear area, the bottom elastic band (3), and the inner semi-circle of the breast. The corresponding cups (13) formed by the bra are shaped so as to prevent the breasts from moving and to protect the breasts against rubbing and stretching in the areas in which the sector of the central area (4) does not cover the breasts.
