Abstract (en)

Device for collecting the scraps produced by a spooler both for "dust removal" and for the pieces of yarn, wherein the spooling units are served by single aspirators that individually equip each spooling unit, and are each equipped with a separating filter for the dust and for the pieces of yarn, which collects both materials. All of the filters are connected through a common duct to a common suctioning filter for collecting the spooling scraps that, periodically treating an individual filter at a time, discharges and receives without selection the material retained by such individual filters.
