Abstract (en)
The device (1) has an elastic return unit i.e. helical spring, comprising a spring portion whose movable branch (12) is engaged with a driving abutment of an actuating part (3) and a blocking abutment (15) of a body (2) to move and block the branch along first and second rotating directions (R1, R2) from a neutral position, respectively. A movable branch of another spring portion is engaged with another driving abutment of the part and another blocking abutment of the body to move and block the latter branch along the second and first directions from the neutral position, respectively.

Abstract (fr)
La présente invention a pour objet un dispositif de contrôle rotatif (1) caractérisé en ce qu'il comporte des moyens de rappel élastiques comportant un premier moyen de rappel élastique (10) comportant une branche mobile (12), un deuxième moyen de rappel élastique (20) distinct du premier moyen de rappel élastique (10) comportant une branche mobile (22) ainsi qu'une poignée de télécommande comportant un tel dispositif (1).
