Abstract (en)

[origin: WO2011069600A1] The present invention relates to an electrical terminal, in particular a terminal block, with a housing (2) and a conductor bar (4) held on the housing (2), as well as a fastening screw or a fastening nut (6), which, in the position of use of the electrical terminal, interacts with a nut or screw (8) corresponding thereto in such a way that an electrical conductor to be electrically connected to the conductor bar (4) is clamped between the nut or screw (8) and the conductor bar (4). In order to provide an electrical terminal with which the torque transfer from the fastening screw or nut to the housing is improved, it is proposed that, in the mounting position of the electrical terminal, the screw head of the fastening screw or the fastening nut (6) is completely enclosed at the outer periphery thereof by the housing (2) in a direction perpendicular to the centre axis (10) of the fastening screw or nut (6), wherein the housing (2) is formed in the contact region in a way corresponding to the outer contour of the fastening screw or nut (6).
