Abstract (en)

The finding concerns a skin introducing group for a splitting machine, used for splitting (dividing) skins in the transversal direction, so as to obtain a valuable upper part - the "grain" - and a less valued lower part - the "split"; such a machine consists of a frame (M) that supports two parallel and opposite rollers, one known as calibrator and the other known as compensator, between which the skin slides, as well as a splitting blade that takes care of cutting the skin into the aforementioned two parts. Such a splitting machine is also provided with a skin introducing group (1), which is used as an alternative to a fixed introduction table (T), said group being made up of a pair of mats (2, 3). Such an introducing group (1) is characterised in that each of the two mats (2, 3) is equipped with a ratiomotor (2.1, 3.1), the speed of which, through an electrical actuation, is able to be slowed down to exert a braking action on each skin during the splitting operating. Moreover, said introducing group is supported by a particular articulated structure (10). (Fig. 1).
