Abstract (en)

[origin: WO2011040854A1] The invention concerns a pad-like support device (1) intended to be attached between a horse's hoof (2) and a horseshoe (3) with the intention of facilitating movement in a horse's hoof. The pad-like support device (1) includes at least one first side part (6), at least one second side part (7), at least one middle part (8) and a support section (9) for the frog. The pad-like support device's (1) uniqueness lies in that it includes at least one first flexible zone (10) and at least one second flexible zone (11), which essentially extend along the longitudinal direction of the pad-like support device. This design results in the support section (9) and the middle part (8) being flexibly arranged in the horizontal and vertical directions relative to the first side part (6) and the second side part (7) and that the flexibility of the flexible zones (10, 11) increases in the backward direction.
