Abstract (en)
[origin: WO2011075075A1] Disclosed is a micropipette provided with a capillary tube adapted for collecting a well-defined volume of liquid by capillary action, a gas displacement mechanism, and a tubular body to which ends the capillary tube and the gas displacement mechanism are connected, respectively. The inner surfaces of the capillary tube and the tubular body have different capillary capacity. The micropipette may be used for collecting and discharging well- defined volumes of liquid and for mixing a first collected volume of liquid in a second volume of liquid, which may be larger than the first volume of liquid.
