Abstract (en)

[origin: WO2011073129A1] Continuous process for preparing a halogenated polymer comprising a step of polymerization of at least one halogenated monomer in a medium comprising carbon dioxide in the liquid or supercritical state, in at least one pressurized reactor, said process comprising at least : - (1) an expansion of the suspension resulting from the reactor; - (2) a separation of the expanded suspension resulting from the reactor into a first stream, containing the solid phase comprising the halogenated polymer and into a liquid, gaseous or supercritical second stream, which is a mixture Of CO<sub>2</sub> and of monomer not converted to polymer; and the recovery of this first stream and of this second stream; the expansion (1) of the suspension resulting from the reactor and its separation (2) into first and second streams are carried out in several steps at successively decreasing pressures. - (3) an optional reheating, applied to the expanded suspension, before or after its separation into first and second streams, with optional recovery of the cold energy generated by the expansion; - (4) a recompression of the second stream, and the optional cooling thereof, in order to recycle it to the reactor feed, with a fresh monomer make-up and, possibly, a CO<sub>2</sub> make-up; - (5) a final step of degassing the halogenated polymer, optionally in combination with a continuous technique of forming the polymer into granules. Device for implementing the process.
