Abstract (en)

A mounting device for a safety line anchor has a first mounting aspect and a second mounting aspect, each mounting aspect enabling mounting to a differently shaped structure. One of the mounting aspects comprises a recess formation and the other of the mounting aspects comprises a shoulder formation. The recess formation and the shoulder formation are positioned on opposed sides of the device. The recess formation is capable of receiving a circular and/or square section ladder rung and the shoulder formation is provided with substantially perpendicular reaction surfaces against which an L shaped ladder rung can be anchored.
