Abstract (en)

The present invention relates to a process for treating a component (1) for a line for conducting oxygen. A coating (3) of a coating material (4) is applied by electroplating at least to the surface (2) of the component (1) which is in contact with the oxygen during operation of the line. The process according to the invention establishes a bond between the coating (3) and the component (1) which withstands even the greatest mechanical demands and therefore makes reliable operation of a line for gaseous oxygen possible.
