Abstract (en)
[origin: EP2518241A1] The door lock (1) has a closure element (8), a closure element drive (10), by which the actuation of the closure element is movable from a closing position in an open position and a blocking unit (27) for the closure element drive. A mode-switching unit (39) is actuated for the purpose of a deactivation of the activated blocking unit by the actuation of the closure element drive, if the activated blocking unit is transferred in a condition releasing the closure element drive by an additional switching unit.
