Abstract (en)

[origin: EP2518423A2] The method involves setting inlet temperature greater than 70[deg] C and outlet temperature greater than 120[deg] C by a joule process. The pressure in the low pressure side is adjusted to the value equal to or twice the value of the critical pressure of the used working material. The pressure value in the low pressure side is set in range of 74-110 bar. An independent claim is included for supercritical heat pump.
