Abstract (en)

Plastic fiber (2) for artificial turf covering comprises a first plastic component (4) and a second plastic component (6) embedded in the first plastic component, where the second plastic component exhibits a higher resilience than the first plastic component and is formed in the form of at least two strands (8a) extending in the longitudinal direction of the plastic fiber. The plastic fiber exhibits essentially a shape in cross-section having a first symmetrical axis and a second symmetrical axis extending perpendicular to the first axis of symmetry. Plastic fiber for artificial turf covering comprises a first plastic component (4) and a second plastic component (6) embedded in the first plastic component, where the second plastic component exhibits a higher resilience than the first plastic component and is formed in the form of at least two strands (8a) extending in the longitudinal direction of the plastic fiber. The plastic fiber exhibits essentially a shape in cross-section having a first symmetrical axis and a second symmetrical axis extending perpendicular to the first axis of symmetry, where the extension in the direction of the second symmetrical axis is less than the extension in the direction of the first symmetrical axis. An independent claim is also included for the artificial turf comprising a flat support and utilizable pile that is formed from pile threads connected with the support, where the pile threads of utilizable pile are formed at least partially from the plastic fiber.

Abstract (de)

Die Erfindung betrifft eine Kunststofffaser für einen Kunstrasenbelag umfassend eine erste Kunststoffkomponente (4) und eine in der ersten Kunststoffkomponente (4) eingebettete zweite Kunststoffkomponente (6). Erfindungsgemäß weist die zweite Kunststoffkomponente (6) ein höheres Rückstellvermögen als die erste Kunststoffkomponente (4) auf und ist in Form von mindestens zwei in Längsrichtung der Kunststofffaser verlaufenden Strängen (8a-8e) ausgebildet. Die Kunststofffaser ist dadurch gekennzeichnet, dass sie im Querschnitt im Wesentlichen eine Form mit einer ersten Symmetriearchse (A) und einer rechtwinklig zur ersten Symmetriearchse verlaufenden zweiten Symmetriearchse (B) aufweist, wobei die Ausdehnung in Richtung der zweiten Symmetriearchse (B) geringer ist als die Ausdehnung in Richtung der ersten Symmetriearchse (A).
