Abstract (en)  
[origin: EP2520745A2] The cylinder has cylinder housings (1,2) which receive the cylinder cores which are in engagement with the cam recess (5). Each cylinder core has core extensions (6,8) which are provided for rotation of locking cam and are brought into engagement with the cam recess. The connection is formed such that the core extensions are adapted to different cylinder housing lengths so that different axial spacing of cores relative to each other and relative to cam recess are stored axially displaceable. The cylinder housings on crossbar (3) are axially displaceable and fixable.
