Abstract (en)

[origin: EP2522618A1] The method involves aligning a crane boom (5) and a lattice piece (1) of a boom extension (2) with each other. The crane boom is connected with the lattice piece by traction. A tension mechanism is provided for partially aligning the axes of the joints of the crane boom and the lattice piece. The longitudinal axis of the crane boom is inclined at an angle (30) of 1-2[deg] relative to horizontal plane by adjusting the adjustable axle suspension. The inclination of the longitudinal axis of the crane boom is controlled by a crane support. An independent claim is included for mobile crane.
