Abstract (en)
[origin: EP2522770A2] The dryer (1) has a slip joint (3) displaceably mounted along a stand pipe (2) for opening the dryer. Support arms (4) of the dryer are hinged at the slip joint. The slip joint is transferred from a lower position into an upper position by actuating a lifting device i.e. lifting cord. The dryer is closed in the lower position and opened in the upper position. A sliding element is arranged above the slip joint and runs ahead of the slip joint by a part of an opening movement. Openings are formed in a region of an upper end of the pipe. The sliding element is formed by a slip joint projection.
