Abstract (en)

[origin: EP2523022A1] The light module (6,9,10) has multiple light sources for emitting light. The light module is designed such that light beams pass through different areas of projection lens. The light beams are generated from two light source groups. The latter light beam is generated by latter light source group and formed such that a bright-dark boundary of a partial light distribution is arranged above a bright-dark boundary of another partial light distribution.
