Abstract (en)

[origin: WO2011086318A1] The present invention relates to a composition made of a fluorinated polymer and a white inorganic filler, said composition being intended for the production of single-layer films that are opaque to visible light and to UV rays, which can be used in particular in the field of photovoltaic cells. The polymer composition is made of a fluorinated polymer and zinc oxide (ZnO), said filler being in said composition in a proportion of 20 wt% to 40 wt%, preferably 20 wt% to 35 wt%. By using said filler it is possible to avoid adding acrylic polymers to the fluorinated polymer as well as to use implementation temperatures that are compatible with production by extrusion-blowing of a single-layer film, namely a temperature of the order of 220°C to 260°C, thus preventing the breakdown of the fluorinated polymer.
