Abstract (en)
[origin: EP2524613A1] The clasp has a first and second mobile blades (2, 3) arranged such that the second blade covers the first blade when the mobile blades are folded on a fixed blade (1). A push-button (7) has unlocking units arranged such that the second blade covers a portion of the first blade and is locked by the push-button when the mobile blades are folded. The units cooperate with the first blade to lift and space the fixed blade that drives the second blade with it, to release the second blade from locking action of the push-button when the push-button is pivoted against action of a return spring (71). The return spring is an edge spring.
