Abstract (en)  
[origin: EP2524637A1] The dispenser (1) has a main flow path (3) guided through a heating device (2) e.g. continuous-flow heater or boiler, and an auxiliary flow path (4) bypassing the heating device. The auxiliary flow path is branched from the main flow path at the upstream of the heating device. The main flow path is connected with a water tank (5) at an input-side and connected with a discharging point (6) at an output side. A main flow pump (7) is arranged in the main flow path between the water tank and the heating device, and an auxiliary flow pump (8) is arranged in the auxiliary flow path. The main flow pump and/or the auxiliary flow pump is designed as a vane pump, gear pump or magnetic piston pump.
