Abstract (en)

[origin: EP2525029A2] The device (60) has a movable carrier retracted within a motor car (5) in a position (1) and projecting from the motor car in another position, where the carrier is moved between the two positions by a drive. A camera captures an image of an outer region (6) of the motor car and is arranged at the carrier. The drive comprises a lever mechanism that is provided with a force retaining element. The retaining element retains force affecting the carrier such that the carrier functions as an operating member for a movable part (7) in the latter position.
