Abstract (en)
[origin: CA2787355A1] The invention relates to an assembly comprising an overmolded element having hooks that is to be overmolded onto a molded object, the overmolded element forming an inner open space defined by two end side walls and a base from which hooks from the element project. Said assembly moreover comprises a mold, the inner walls of which define an inner space of the shape of the object to be formed by molding in the mold, at least one pedestal projecting into the space from said inner wall(s), the overmolded element being, during the flow of the molding foam, in contact with the pedestal. The pedestal comprises a wall-shaped portion having two opposite outer side surfaces, and during the flow of the foam, the respective end side walls of the overmolded element are in contact with the respective opposite outer side surfaces, with no hooks interposed therebetween.
