Abstract (en)
[origin: WO2011088971A1] The invention relates to a method for detecting a target (8) by means of a flying object (2) held by a carrier platform (4), comprising a seeker head, with which the target (8) is sighted and target data are transmitted to a seeker system (12) of the flying object (2). According to the invention, the seeker system (12) of the flying object (2) captures the target (8) as a target on the basis of the transmitted target data while the view of the target (8) is blocked for the seeker head. The target can be detected by means of the flying object still hidden in the carrier platform without having to forgo good camouflage properties of the carrier platform.
