Abstract (en)

[origin: US2011178925A1] A token based transaction authentication system is disclosed. Issuer, merchants, and a payment processing network generate unique tokens or keys to authenticate messages between themselves and to authenticate a sending entity or consumer as they are redirected between entities. The tokens are also used to identify the particular authentication thread a message or sending entity is associated with. The sending entity authentication occurs over a web-based channel or a mobile based channel.
