Abstract (en)
[origin: WO2012062556A1] The invention relates to a method for operation of a high-pressure discharge lamp below its nominal power, wherein the high-pressure discharge lamp is operated at the nominal power level with an alternating current at a predetermined operating frequency, and the lamp voltage is measured during one half-cycle, at least at the start of a half-cycle and at the end of a half-cycle, with the following steps: - reduction of the instantaneous operating frequency below an upper limit, - changing the current waveform of the alternating current to a current waveform which is in the form of a pitched roof and is dependent on the difference between the lamp voltages at the end and at the start of the half-cycle, in which the magnitude of the current |Istart| at the start of the half-cycles with respect to the magnitude of the current |Iend| at the end of the half-cycles behaves in a manner such as |Istart|:|Iend| = 1:1.2.. 1:3.0. The invention likewise relates to a circuit arrangement for operation of a high-pressure discharge lamp below its nominal power, wherein the high-pressure discharge lamp is operated at the nominal power with an alternating current at a predetermined operating frequency, and the circuit arrangement carries out the method described above.
