Abstract (en)

[origin: WO2011066972A1] The invention comprises a shell-like upper housing part and a shell-like lower housing part. The two-part housing is formed such that it can be sealed tightly against any external environmental influences (gases, vapors, moisture, liquids, dust, chemicals and bacteria) without any ventilation to dissipate the heat developed in the housing. The two-part housing is formed completely without any rim on the outside and has a continuously smooth, joint-free surface, which is designed such that it can be sealed with a coating in the nanometre range that repels contamination and bacteria.
