Abstract (en)

[origin: EP2527562A1] The corner cladding is made of two strip-shaped portions (1,2) that are successively introduced into shaping device for bending along the longitudinal axis. The protrusion of bending portion (3) is coated with permanently elastic plastic, after heating process, and is then cut on a narrow side to form a contact line along a wall edge. The contact lines in bending area of strip-shaped portions are formed to receive round transition such as impact zone, such that impact zone on back of corner cladding is coated with a plastic injection molding material, to form reinforcement (9). An independent claim is included for corner cladding.
