Abstract (en)

[origin: EP2527607A2] The device has a shaft arrangement with two camshafts (1,2), where one of the camshafts is extended in an axial shaft section. The camshafts are rotated relative to each other. A phase adjuster is mounted at an axial end of the shaft arrangement as mounting unit. A stator (3) is connected with the former camshaft in rotary fixed manner. A rotor (9) is rotary angular adjusted relative to the stator and is rotary driven from the stator. A connecting device fixes the phase shifter at the shaft arrangement in relation to the axial direction. An independent claim is included for a phase adjuster for adjusting angular position, which has an engagement surface with teeth.
