Abstract (en)

[origin: EP2527743A2] The component has inner and outer combustion chamber walls (11, 12) shielded from an environment when a fuel flame extends along burner axes (21) during operation of the component. The combustion chamber walls comprise projections in a direction away from the burner axes. The fuel flame is arranged between the combustion chamber walls. The projections of the combustion chamber walls are adapted to a contour of the fuel flame during operation of the component. Length and/or width of the projections correspond to length and/or width of the fuel flame. Independent claims are also included for the following: (1) an annular combustion chamber (2) a method for manufacturing an annular combustion chamber.
