Abstract (en)  
[origin: EP2528166A1] The clip (1) has first and second wings (2, 3) and a base (4) defining a longitudinal slot (5) for receiving an edge of a support. The wings are traversed by a transversal slot (6) that is arranged perpendicular to the longitudinal slot. The slots are opened on same side of the clip such that width of the longitudinal slot is increased toward the base on a wing portion of the first wing, and simultaneously width of the transversal slot is decreased for cutting an insulating sheath during insertion of a ground wire in the transversal slot. The clip is formed from a metallic plate.
