Abstract (en)

[origin: WO2011089020A2] The invention relates to a soil compaction device, in particular such as a tamper or a vibration plate device, having an internal combustion engine and a tank container for receiving fuel for the operation of said internal combustion engine. According to the invention, there is at least one disconnection apparatus on the soil compaction device which has a mechanical effect on an elastically flexible section (50) of a fuel line arranged between the tank container and the internal combustion engine in order to be able to disconnect the fuel flow, wherein said disconnection apparatus is mechanically coupled to a manually actuated gas actuation apparatus and/or start-stop apparatus for the internal combustion engine, or integrated therein, wherein at least one roll or roller is arranged on the extension which has an effect on the elastically flexible section of the fuel line in order to disconnect the fuel flow.
