Abstract (en)
[origin: WO2011092572A1] Interface device for an apparatus for processing a plurality of multi-medial high resolution operative programs and functions, integrated with a television receiver screen, for setting and performing such multi-medial operative programs and functions for personal computers and television receivers, and displaying the same onto such video screen, wherein the apparatus comprises a master microprocessor (1) and audio and video control means (7) connected to a plurality of external electronic appliances and/ or systems. Interface device (2) comprising a second microprocessor (39) connected to the master microprocessor (1) and a first microprocessor (6) of the audio and video control means (7) of the apparatus and which can be programmed through a sensor circuit (40) and an external remote control device (54). Such master microprocessor (1) is also connected to a further plurality of external electronic appliances and/ or systems (29-38'), adapted to transmit corresponding operative programs and functions, and can be programmed by additional selector means (28) too, and is finally set for controlling all the operative programs and functions of all the electronic appliances and all the electronic systems connected thereto, as well as to modify in different extent - depending on the user need - such operative programs and functions in the apparatus referred to and all the external electronic appliances and systems.
