Abstract (en)
[origin: WO2011095328A1] The invention relates to a segment for a concrete surface finisher having a smoothing surface (3) designed in one or multiple parts for treating a concrete surface to be finished by pulling the segment transversely to the longitudinal extension thereof over the concrete surface, and comprises connecting means arranged on both longitudinal ends in the region of the smoothing surface (3) for connecting to further segments that can be rotated about a horizontal transverse axis in relation to the longitudinal extension. A frame structure (9) is arranged above the smoothing surface and comprises means for a longitudinally adjustable connection (21) to further segments on both longitudinal ends in order to set the angle for the connection to the further segments. In the region of the frame structure (9), a supply channel (4) for energy supply lines for vibration elements (15, 25) is provided.
