Abstract (en)
[origin: WO2011092117A1] The invention relates to a separating element (1) for spatial division of a region of an inner chamber (43) of a household refrigeration device (4), wherein the separating element (1) divides the shelf regions of refrigerated goods containers (2) and/or shelf plates (3) into multiple regions, characterized in that the separating element (1) has at least one wall element (12) and at least one fastening element (11) and can be flexibly arranged and removed again on any surfaces and refrigerated goods containers (2) for receiving refrigerated goods in the inner chamber (43) of a household refrigeration device (4), having a floor surface (21) and a side wall (22) at least partially surrounding said surface and a separating element (1) and a household refrigeration device (4) for receiving refrigerated goods, having an inner chamber (43) which can be sealed by a door (41) having one or more refrigerated goods containers (2) and/or shelf surfaces (3) which form shelf regions of the inner chamber (43) of the household refrigeration device and are divided by at least one separating element (1).
